# DRUMS

Reconditioned (Steel & Plastic)  
Remanufactured (Steel)

Auckland Drum Sustainability Services is New Zealand's leading service provider for the collection and supply of 'hard to recycle' packaging. From drums and intermediate bulk containers (IBCs) through to tailored industry and customer recycling programs, Auckland Drum provides a unique service with a commitment to finding end-of-life solutions for packaging that cannot be collected via traditional recycling networks.

## Drums

Auckland Drum provides a national service for the collection and supply of both reconditioned and remanufactured drums.

Steel and plastic drums are cleaned using automated washing facilities and thermal oxidation and shot blasting removes 'hard to handle' residues.

Steel drums can be remanufactured with new FDA Food Contact Approved lining and either a closed or open head which has applications for both food grade and industrial packaging.

Both reconditioned and remanufactured drums are available with custom decoration, closures and lining options.

## IBCs

Auckland Drum provides a comprehensive service for the collection and supply of reconditioned, remanufactured and new IBCs.

All reconditioned IBCs go through a tightly controlled quality process that ensures the bottle and cage are thoroughly cleaned, components are checked and replaced if necessary and the IBC is pressure tested for leaks.

Remanufactured IBCs are a cost effective alternative to a new IBC and combine the integrity of a new food contact approved bottle with the economy of a reconditioned cage. Auckland Drum is the sole reseller of new Mauser IBCs in New Zealand when a new bottle and new cage are required. Spare IBC parts are also available.

## Dangerous Goods (DG) Recertification

If your company transports DG rated products, Auckland Drum is qualified to recertify drums and IBCs to DG standard - a legal requirement when transporting dangerous goods domestically or for export. All reconditioned drums and IBCs are clearly labelled with relevant information including DG recertification, production date and drum collection information.

# COLLECTION SERVICES

Tailored collection programs for 'hard to recycle' packaging

## Collection Services

Industrial packaging is often 'hard to recycle' as it contains residues which make it difficult to process and there is limited infrastructure available to efficiently collect it. Whether you're a council, corporate or commercial farm, Auckland Drum can provide a tailored collection service for your 'hard to recycle' packaging which cannot be collected via traditional recycling networks. This service enables you to divert your industrial packaging from landfill so it can be reprocessed into valuable resources once again.

What will Auckland Drum do with your used packaging?

- Drums and IBCs will be reconditioned or remanufactured so they can be reused
- Used packaging will be converted into post consumer recyclate (PCR) for use in new industrial products
- If it cannot be reconditioned, remanufactured or recycled in-house, it will be consolidated for collection and processing by steel and plastic recyclers

## A Better Choice

Reconditioning and remanufacturing extends the life cycle of packaging without compromising quality and provides a cost effective and complimentary alternative to new packaging. Life cycle analysis confirms, for example, that the reconditioning of a steel drum provides a significant benefit over an equivalent new drum in terms of material consumption and CO<sub>2</sub> emissions.

Auckland Drum's processes are safe and compliant with accepted environmental standards and stringent procedures ensure that any harmful residues in waste drums are disposed of appropriately to minimise environmental impact.
